Rat - An Overview

Rats and mice can be major pest problems in residential and commercial properties. They damage food, books, documents and clothing. Damage to a structure occurs when rats and mice gnaw on structural components, including wiring, wood and plastics. The gnawing on wire insulation or network cables can result in electrical shorts and fires. Rodents have also been implicated in the spread of dangerous human diseases. Structural risks, health risks and a general lowering of environmental quality accompany any rodent infestation.

- "RAT" means gnawing animal.
- Their teeth grow 5" every year
- Rats have poor vision and see in black and white.
- They can eat 1/3 rd of their weight every day
- Rats can go about 14days without food.
- Rats can dive about 100 feet under water

❖ **One breeding pair can produce upto 2000 offsprings in a year**
